

41. Computational Theory of Mind: The Long View

Cognition as Computation

My hypothesis then is that thought models, or parallels, reality—that its essential feature is not ‘the mind’, ‘the self’, ‘sense-data’, nor propositions but symbolism, and that this symbolism is largely of the same kind as that which is familiar to us in mechanical devices which aid thought and calculation.

For language is quite peculiarly confronted by an unending and truly boundless domain, the essence of all that can be thought. It must therefore make infinite employment of finite means, and is able to do so through the power which produces identity of language and thought.

Humbolt, “On Language”, 1836

Levels of Computational Abstraction

Cognition as Natural Computation
